Farmer A grows apples of a certain variety. Each tree produces 14.8 kg of apples, on average, per year. Farmer B grows apples of the same variety and claims that his apple trees produce a higher mass of apples per year than Farmer A's trees. The masses of apples from Farmer B's trees may be assumed to be normally distributed.

A random sample of 10 trees from Farmer B is chosen. The masses, x kg, of apples produced in a year are summarised as follows.

| | $\sum x = 152.0$ | $\sum x^2 = 2313.0$ | | |
|-----------------------------------|------------------|-----------------------|-------|-----|

A company is developing a new flavour of chocolate by varying the quantities of the ingredients. A random selection of 9 flavours of chocolate are judged by two tasters who each give marks out of 100 to each flavour of chocolate.

| Chocolate | A | В | С | D | E | F | G | Н | I |
|-----------|----|----|----|----|----|----|----|----|----|
| Taster 1 | 72 | 86 | 75 | 92 | 98 | 79 | 87 | 60 | 62 |
| Taster 2 | 84 | 72 | 74 | 95 | 85 | 87 | 82 | 75 | 68 |

| Carry out a Wilcoxon matched-pairs signed-rank test at the 10% significance level to investigate whether, on average, there is a difference between marks awarded by the two tasters. [7] | | | | | | | |

3 The heights, x m, of a random sample of 50 adult males from country A were recorded. The heights, y m, of a random sample of 40 adult males from country B were also recorded. The results are summarised as follows.

$$\Sigma x = 89.0$$
 $\Sigma x^2 = 159.4$ $\Sigma y = 67.2$ $\Sigma y^2 = 113.1$

| Find a 95% confidence interval for the A and adult males from country B. | the difference between the mean heights of adult males from country [8] |

4 X is a discrete random variable which takes the values $0, 2, 4, \ldots$. The probability generating function of X is given by

$$G_X(t) = \frac{1}{3 - 2t^2}.$$

The manager now takes a larger sample and claims that the numbers of breakages in a one-hour period follow a Poisson distribution. The numbers of breakages in a random sample of 180 one-hour periods are summarised in the following table.

| Number of breakages | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 or more |
|---------------------|----|----|----|----|----|----|----|-----------|
| Frequency | 21 | 33 | 46 | 31 | 23 | 16 | 10 | 0 |

The mean number of breakages calculated from this sample is 2.5.

| (b) | Use the data from this larger sample to carry out a goodness of fit test, at the 10% significance level, to test the claim. [8] |
