

1 A car starts from rest and moves in a straight line with constant acceleration for a distance of 200 m, reaching a speed of 25 m s^{-1} . The car then travels at this speed for 400 m, before decelerating uniformly to rest over a period of 5 s.

(a) Find the time for which the car is accelerating. [2]

.....

.....

.....

.....

.....

(b) Sketch the velocity–time graph for the motion of the car, showing the key points. [2]

(c) Find the average speed of the car during its motion. [2]

- 2 Two particles P and Q , of masses 0.5 kg and 0.3 kg respectively, are connected by a light inextensible string. The string is taut and P is vertically above Q . A force of magnitude 10 N is applied to P vertically upwards.

Find the acceleration of the particles and the tension in the string connecting them. [5]

Three coplanar forces of magnitudes 20 N, 100 N and F N act at a point. The directions of these forces are shown in the diagram.

Given that the three forces are in equilibrium, find F and α . [6]

A series of horizontal dotted lines for writing.

Car *B* starts off at the same instant as car *A*. The two cars arrive at *P* simultaneously and with the same speed. The engine of *B* produces a driving force of 3200 N and the car experiences a constant resistance to motion of 1200 N.

(b) Find the mass of *B*. [3]

(b) It is given that the acceleration of the particle is -13.5 m s^{-2} for the positive value of t at which $v = 0$.

Find k and hence find the total distance travelled in the first two seconds of motion. [6]

7 Two particles A and B , of masses 0.4 kg and 0.2 kg respectively, are moving down the same line of greatest slope of a smooth plane. The plane is inclined at 30° to the horizontal, and A is higher up the plane than B . When the particles collide, the speeds of A and B are 3 m s^{-1} and 2 m s^{-1} respectively. In the collision between the particles, the speed of A is reduced to 2.5 m s^{-1} .

(a) Find the speed of B immediately after the collision. [2]

.....

.....

.....

.....

.....

.....

.....

After the collision, when B has moved 1.6 m down the plane from the point of collision, it hits a barrier and returns back up the same line of greatest slope. B hits the barrier 0.4 s after the collision, and when it hits the barrier, its speed is reduced by 90% . The two particles collide again 0.44 s after their previous collision, and they then coalesce on impact.

(b) Show that the speed of B immediately after it hits the barrier is 0.5 m s^{-1} . Hence find the speed of the combined particle immediately after the second collision between A and B . [7]
