SUGGESTIONS TO DRYUFROMSHANGHAI@QQ.COM

Section A: Pure Mathematics

- 1 Define $\cosh x$ and $\sinh x$ in terms of exponentials and prove, from your definitions, that

$$\cosh^4 x - \sinh^4 x = \cosh 2x$$

and

$$\cosh^4 x + \sinh^4 x = \frac{1}{4} \cosh 4x + \frac{3}{4}.$$

- (i) Find a_0, a_1, \dots, a_n in terms of n such that

$$\cosh^n x = a_0 + a_1 \cosh x + a_2 \cosh 2x + \dots + a_n \cosh nx.$$

- (ii) Hence, or otherwise, find expressions for $\cosh^{2m} x - \sinh^{2m} x$ and $\cosh^{2m} x + \sinh^{2m} x$, in terms of $\cosh kx$, where $k = 0, \dots, 2m$.

- 2 For all values of a and b , either solve the simultaneous equations

$$x + y + az = 2$$

$$x + ay + z = 2$$

$$2x + y + z = 2b$$

or prove that they have no solution.

- 3 (i) Find

$$\int_0^\theta \frac{1}{1 - a \cos x} dx,$$

where $0 < \theta < \pi$ and $-1 < a < 1$.

- (ii) Hence show that

$$\int_0^{\frac{1}{2}\pi} \frac{1}{2 - a \cos x} dx = \frac{2}{\sqrt{4 - a^2}} \tan^{-1} \sqrt{\frac{2 + a}{2 - a}},$$

and also that

$$\int_0^{\frac{3}{4}\pi} \frac{1}{\sqrt{2} + \cos x} dx = \frac{\pi}{2}.$$

- 4 (i) Find the integers k satisfying the inequality $k \leq 2(k - 2)$.
- (ii) Given that N is a strictly positive integer consider the problem of finding strictly positive integers whose sum is N and whose product is as large as possible. Call this largest possible product $P(N)$. Show that $P(5) = 2 \times 3$, $P(6) = 3^2$, $P(7) = 2^2 \times 3$, $P(8) = 2 \times 3^2$ and $P(9) = 3^3$.
- (iii) Find $P(1000)$ explaining your reasoning carefully.

- 5 Show, using de Moivre's theorem, or otherwise, that

$$\tan 7\theta = \frac{t(t^6 - 21t^4 + 35t^2 - 7)}{7t^6 - 35t^4 + 21t^2 - 1},$$

where $t = \tan \theta$.

- (i) By considering the equation $\tan 7\theta = 0$, or otherwise, obtain a cubic equation with integer coefficients whose roots are

$$\tan^2\left(\frac{\pi}{7}\right) \quad \text{and} \quad \tan^2\left(\frac{2\pi}{7}\right) \quad \text{and} \quad \tan^2\left(\frac{3\pi}{7}\right)$$

and deduce the value of

$$\tan\left(\frac{\pi}{7}\right) \tan\left(\frac{2\pi}{7}\right) \tan\left(\frac{3\pi}{7}\right).$$

- (ii) Find, without using a calculator, the value of

$$\tan^2\left(\frac{\pi}{14}\right) + \tan^2\left(\frac{3\pi}{14}\right) + \tan^2\left(\frac{5\pi}{14}\right).$$

- 6 (i) Let S be the set of matrices of the form

$$\begin{pmatrix} a & a \\ a & a \end{pmatrix},$$

where a is any real non-zero number. Show that S is closed under matrix multiplication and, further, that S is a group under matrix multiplication.

- (ii) Let G be a set of $n \times n$ matrices which is a group under matrix multiplication, with identity element \mathbf{E} . By considering equations of the form $\mathbf{BC} = \mathbf{D}$ for suitable elements \mathbf{B} , \mathbf{C} and \mathbf{D} of G , show that if a given element \mathbf{A} of G is a singular matrix (i.e. $\det \mathbf{A} = 0$), then all elements of G are singular. Give, with justification, an example of such a group of singular matrices in the case $n = 3$.

- 7 (i) If $x + y + z = \alpha$, $xy + yz + zx = \beta$ and $xyz = \gamma$, find numbers A, B and C such that

$$x^3 + y^3 + z^3 = A\alpha^3 + B\alpha\beta + C.$$

Solve the equations

$$\begin{aligned}x + y + z &= 1 \\x^2 + y^2 + z^2 &= 3 \\x^3 + y^3 + z^3 &= 4.\end{aligned}$$

- (ii) The area of a triangle whose sides are a, b and c is given by the formula

$$\text{area} = \sqrt{s(s-a)(s-b)(s-c)}$$

where s is the semi-perimeter $\frac{1}{2}(a + b + c)$. If a, b and c are the roots of the equation

$$x^3 - 16x^2 + 81x - 128 = 0,$$

find the area of the triangle.

- 8 A transformation T of the real numbers is defined by

$$y = T(x) = \frac{ax - b}{cx - d},$$

where a, b, c, d are real numbers such that $ad \neq bc$. Find all numbers x such that $T(x) = x$. Show that the inverse operation, $x = T^{-1}(y)$ expressing x in terms of y is of the same form as T and find corresponding numbers a', b', c', d' .

- (i) Let S_r denote the set of all real numbers excluding r . Show that, if $c \neq 0$, there is a value of r such that T is defined for all $x \in S_r$ and find the image $T(S_r)$. What is the corresponding result if $c = 0$?
- (ii) If T_1 , given by numbers a_1, b_1, c_1, d_1 , and T_2 , given by numbers a_2, b_2, c_2, d_2 are two such transformations, show that their composition T_3 , defined by $T_3(x) = T_2(T_1(x))$, is of the same form.
- (iii) Find necessary and sufficient conditions on the numbers a, b, c, d for T^2 , the composition of T with itself, to be the identity. Hence, or otherwise, find transformations T_1, T_2 and their composition T_3 such that T_1^2 and T_2^2 are each the identity but T_3^2 is not.

Section B: Mechanics

- 9 A particle of mass m is at rest on top of a smooth fixed sphere of radius a . Show that, if the particle is given a small displacement, it reaches the horizontal plane through the centre of the sphere at a distance

$$a(5\sqrt{5} + 4\sqrt{23})/27$$

from the centre of the sphere.

[Air resistance should be neglected.]

- 10 Two rough solid circular cylinders, of equal radius and length and of uniform density, lie side by side on a rough plane inclined at an angle α to the horizontal, where $0 < \alpha < \pi/2$. Their axes are horizontal and they touch along their entire length. The weight of the upper cylinder is W_1 and the coefficient of friction between it and the plane is μ_1 . The corresponding quantities for the lower cylinder are W_2 and μ_2 respectively and the coefficient of friction between the two cylinders is μ . Show that for equilibrium to be possible:

(i) $W_1 \geq W_2$;

(ii) $\mu \geq \frac{W_1 + W_2}{W_1 - W_2}$;

(iii) $\mu_1 \geq \left(\frac{2W_1 \cot \alpha}{W_1 + W_2} - 1 \right)^{-1}$.

Find the similar inequality to (iii) for μ_2 .

- 11 A smooth circular wire of radius a is held fixed in a vertical plane with light elastic strings of natural length a and modulus λ attached to the upper and lower extremities, A and C respectively, of the vertical diameter. The other ends of the two strings are attached to a small ring B which is free to slide on the wire.

- (i) Show that, while both strings remain taut, the equation for the motion of the ring is

$$2ma\ddot{\theta} = \lambda(\cos \theta - \sin \theta) - mg \sin \theta,$$

where θ is the angle $\angle CAB$.

- (ii) Initially the system is at rest in equilibrium with $\sin \theta = \frac{3}{5}$. Deduce that $5\lambda = 24mg$.

- (iii) The ring is now displaced slightly. Show that, in the ensuing motion, it will oscillate with period approximately

$$10\pi\sqrt{\frac{a}{91g}}$$

Section C: Probability and Statistics

12 It has been observed that Professor Ecks proves three types of theorems:

- 1, those that are correct and new;
- 2, those that are correct, but already known;
- 3, those that are false.

It has also been observed that, if a certain of her theorems is of type i , then her next theorem is of type j with probability p_{ij} , where p_{ij} is the entry in the i th row and j th column of the following array:

$$\begin{pmatrix} 0.3 & 0.3 & 0.4 \\ 0.2 & 0.4 & 0.4 \\ 0.1 & 0.3 & 0.6 \end{pmatrix}.$$

Let a_i , $i = 1, 2, 3$, be the probability that a given theorem is of type i , and let b_j be the consequent probability that the next theorem is of type j .

- (i) Explain why $b_j = a_1p_{1j} + a_2p_{2j} + a_3p_{3j}$.
- (ii) Find values of a_1, a_2 and a_3 such that $b_i = a_i$ for $i = 1, 2, 3$.
- (iii) For these values of the a_i find the probabilities q_{ij} that, if a particular theorem is of type j , then the *preceding* theorem was of type i .

13 (i) Let X be a random variable which takes only the finite number of different possible real values x_1, x_2, \dots, x_n . Define the expectation $E(X)$ and the variance $\text{var}(X)$ of X . Show that, if a and b are real numbers, then $E(aX + b) = aE(X) + b$ and express $\text{var}(aX + b)$ similarly in terms of $\text{var}(X)$.

(ii) Let λ be a positive real number. By considering the contribution to $\text{var}(X)$ of those x_i for which $|x_i - E(X)| \geq \lambda$, or otherwise, show that

$$P(|X - E(X)| \geq \lambda) \leq \frac{\text{var}(X)}{\lambda^2}.$$

(iii) Let k be a real number satisfying $k \geq \lambda$. If $|x_i - E(X)| \leq k$ for all i , show that

$$P(|X - E(X)| \geq \lambda) \geq \frac{\text{var}(X) - \lambda^2}{k^2 - \lambda^2}.$$

- 14 (i) Whenever I go cycling I start with my bike in good working order. However if all is well at time t , the probability that I get a puncture in the small interval $(t, t + \delta t)$ is $\alpha \delta t$. How many punctures can I expect to get on a journey during which my total cycling time is T ?
- (ii) When I get a puncture I stop immediately to repair it and the probability that, if I am repairing it at time t , the repair will be completed in time $(t, t + \delta t)$ is $\beta \delta t$. If $p(t)$ is the probability that I am repairing a puncture at time t , write down an equation relating $p(t)$ to $p(t + \delta t)$, and derive from this a differential equation relating $p'(t)$ and $p(t)$. Show that

$$p(t) = \frac{\alpha}{\alpha + \beta} (1 - e^{-(\alpha + \beta)t})$$

satisfies this differential equation with the appropriate initial condition.

- (iii) Find an expression, involving α, β and T , for the time expected to be spent mending punctures during a journey of total time T . Hence, or otherwise, show that, the fraction of the journey expected to be spent mending punctures is given approximately by

$$\frac{\alpha T}{2} \quad \text{if } (\alpha + \beta)T \text{ is small,}$$

and by

$$\frac{\alpha}{\alpha + \beta} \quad \text{if } (\alpha + \beta)T \text{ is large.}$$
